

1. Try applying as many attributes and restrictions and observe the form behavior
Understand the difference between `target:blank` and `target:self`

Ans:

- **`target="_blank"`**: Specifies that the form response will be displayed in a new browser window or tab. This means that when the form is submitted, the result will be opened in a new tab, while the original page remains unchanged.
- **`target="_self"`**: Specifies that the form response will be displayed in the same browser window or frame that the form was submitted from. This means that when the form is submitted, the result will replace the current page with the response.
